### Status of Elm species or species-pairs

Brian Eversham

August 2021

About half the elm species are quite distinctive, and will a little practice are probably recognisable without keying. Only about ten are common or widespread. In this table, all species recorded from 10 or more vice-counties are included in the left column, except those marked \* which are known from more than 10, but are generally rare or difficult to find. Those marked @ are mainly East Anglian/Midland. The pairs are species which are difficult to separate but are fairly distinctive compared with the rest.
